

A Modularized Approach to Comprehensive System-Wide Computer Simulation of Air Traffic Systems

A THESIS
SUBMITTED TO THE FACULTY OF THE GRADUATE SCHOOL
OF THE UNIVERSITY OF MINNESOTA
BY

Joachim Karl Ulf Hochwarth

IN PARTIAL FULFILLMENT OF THE REQUIREMENTS
FOR THE DEGREE OF
DOCTOR OF PHILOSOPHY
IN AEROSPACE ENGINEERING
WITH A MINOR
IN COMPUTER AND INFORMATION SCIENCES

Yiyuan J. Zhao · Advisor

December 2002

THIS IS TO CERTIFY THAT I HAVE EXAMINED THIS COPY OF A DOCTORAL THESIS BY

Joachim Karl Ulf Hochwarth

AND HAVE FOUND THAT IT IS COMPLETE AND SATISFACTORY IN ALL RESPECTS,
AND THAT ANY AND ALL REVISIONS REQUIRED BY THE FINAL
EXAMINING COMMITTEE HAVE BEEN MADE.

YIYUAN J. ZHAO · ADVISOR(S)

DATE

GRADUATE SCHOOL

Acknowledgements

I would like to thank my advisor Professor Yiyuan J. Zhao for the opportunity to conduct this research at the Department of Aerospace Engineering and Mechanics at the University of Minnesota. It was his enthusiasm that made me decide to stay in the United States for this research. He obtained the NASA support and with his many comments and suggestions helped me to form this thesis and conduct my research.

Many thanks also go to William L. Garrard (Head of Department of Aerospace Engineering and Mechanics) and Klaus H. Well (Director of the Institute of Flight Mechanics and Controls at the University of Stuttgart in Germany) for the opportunity to come to the University of Minnesota as a student to conduct my Master thesis. Professor Garrard invited me to visit the University of Minnesota after Professor Well established the initial contact and allowed me to conduct the thesis abroad.

This research was sponsored by NASA Ames Research Center under Cooperative Agreement NCC2-990 and monitored by Thomas Davis. I would like to take this opportunity to thank him and John Robinson III. John is the FAST project lead of CTAS at NASA Ames and has provided me with endless helpful information and resources.

I would also like to thank my parents Hans and Roswitha Plaettner-Hochwarth for their financial and moral support throughout the entire time of my study. Without their help I would not be where I am today.

Thanks should also go to all the other people who gave me their input and suggestions on the thesis. During the course of the many years of study I have met many people who taught me and have helped me understand what I know today. This is a big thank you to all of them.

Most of all I would like to thank my wife Beth for her encouragement to pursue my dreams, for the support when I worked long hours, and for putting up with me when the thesis occupied my thoughts. I would also like to thank Beth for the patience she had when reviewing and editing this manuscript. Her abilities added a polish to this document that I could not have provided alone. Without her support and persistence I would not have been able to carry out this thesis.

Abstract

The dramatic increase of air traffic over the last decade has caused the air traffic system to come to its full capacity. The projected growth indicates that the system will head into a gridlock in the near future. In order to reduce delays and other problems, several changes to the Air Traffic Management (ATM) system have been proposed. These changes range from short-term solutions such as controller decision support tools to long-term solutions where the decision-making responsibilities are distributed among participating parties to strip the system of its heavily centralized hierarchy.

Any changes to the ATM system and its procedures have to be evaluated and verified before they can be deployed. As a result, developments of verification environments become critically important to further advances in ATM. Due to the complexity of the ATM system as well as the costs and risks associated with flight tests, system-wide computer simulations have become almost the only feasible approach for evaluating automation tools and new concepts.

This thesis will present a new modeling approach to system-wide computer simulation of ATM systems. The main part of the research that will be presented emphasizes the modeling and computer implementation of all relevant ATM components and their dynamic interactions. By introducing an object-oriented modeling approach for each object, it was possible to simulate it “as-it-is” in real life. In the course of deriving the models, it was necessary to develop methods for the application of techniques such as feedback linearization and extrapolation schemes.

The developed simulation model was evaluated by obtaining results from performing a simulation for several simulation scenarios. These results will show that the modularized modeling approach is capable of emulating a realistic behavior of the simulated system. Compared with existing ATM computer simulation programs, the presented simulation model is highly flexible so it can be used to study both the current and future ATM systems. It provides a realistic and consistently accurate simulation environment and is simple to use.

List of Acronyms and Symbols

Greek Symbols

α	Angle of Attack
χ	Velocity Heading
ϕ	Latitude
γ	Flight Path Angle • Isotropic Exponent for Gas
η	Flap/Spoiler Deflection Angle
κ	Engine Throttle Setting
λ	Longitude
μ	Bank Angle • Mean Value
θ	Temperature
ρ	Density
σ	Standard Deviation
ω	Frequency
ζ	Damping
Λ	Wing Aspect Ratio
Φ	Probability Distribution Function

English Symbols

a	Speed of Sound • Semi-Major Axis of the Earth Ellipsoid
b	Semi-Minor Axis of the Earth Ellipsoid
c	Constant
d	Distance
e	Oswald Span Efficiency Factor
f	Flattening
g	Gravitational Constant
h	Altitude
k	Gain
m	Mass
p	Probability Density
q	Dynamic Pressure
r	Radius
t	Time
x	x-Position
y	y-Position
w	Wind
D	Drag
D	Variance
E	Expectation
F	Force

G	Gear
L	Lift
M	Mach Number
P	Probability
R	Specific Ideal Gas Constant
Re	Reynolds Number
S	Gross Wing Area • Spoiler
T	Thrust
V	Velocity
W	Wind

Sub-Scripts

a	Aerodynamic
b	Break
c	Coefficient
d	Desired
f	Fuel • Flap
m	Multiplier
p	Pressure

I	Inertial
L	Lift
MAX	Maximum
MIN	Minimum
R	Radar
SA	Standard Atmosphere
SL	Sea-Level
T	Thrust

Mathematical Notations

$ x $	Absolute Value of x
\approx	Approximately Equal to
Δ	Difference
$!$	Factorial
\int	Integral
\wedge	Logical AND
\vee	Logical OR
\prod	Product
∂	Partial Derivative

Σ	Summation
\dot{x}	Time Derivative of x
\div	to
\bar{x}	Vector of x
$x _i$	x at Point i

Basic Units

[h]	Hour
[min]	Minute
[s]	Second
[ft]	Feet
[in]	Inch
[m]	Meter
[nm]	Nautical Mile
[kn]	Knot $\hat{=}$ [nm/h]
[°]	Degree
[rad]	Radian
[kg]	Kilogram
[lb]	Pound
[K]	Kelvin
[J]	Joule
[ppm]	Part per Million
[-]	No Unit

9.2	Initial states of flight CAA 784 at PNH097067.	.. 156
9.3	Comparison of flight time and fuel consumption of the fly-by and fly-over FMS modes for flight COA 784.	.. 159
9.4	Initial states of flight DAL 306 at DFW.	.. 160
9.5	Position error as well as flight time and fuel consumption with the FMS guidance law turned off and with a 300 [s] update rate.	.. 162
9.6	Initial states of flight COA 606 at the LOA VORTAC.	.. 164
9.7	Specification/statistical data of the simulated radar site at DFW.	.. 165
9.8	Statistics for the radar track position error for flight COA 606.	.. 167
9.9	Time-line of radar related events during flight COA 606. The variables for angles and distances refer to Figure 4.16.	.. 167
9.10	Statistics of the states χ_1 and V_g that were derived from the radar track data of flight COA 606.	.. 169
9.11	Specification/statistical data for the random processor of the data generator.	.. 171
9.12	Initial states of flight KLM 665 at DFW.	.. 173

Chapter 10 Conclusions

-

Appendix A Earth Modeling and Navigational Equations

-

Appendix B Aircraft Performance Data

B.1	Available drag models with manufacturer and model information.	.. 208
B.2	Error of the fourth-order polynomials compared to the available data points for the C_{Dm} and C_{Df} drag coefficients.	.. 222
B.3	Available engine models including manufacturer information.	.. 223

Appendix C Feedback Linearization

-

Appendix D Additional Data

- D.1 Specification of the altimeter error for aircraft equipped with Mode C and .. 260
Mode S transponders.
